1723. STUDY OF A STAPHYLOCOCCAL EPIDEMIC IN A MATERNITY CLINIC AND A WARD FOR NEWBORN INFANTS - Etude d'une épidémie au staphylocoque dans une maternité et dans une section de nouveaux-nés - Manoliu N., Bustea Ch., Brăiloiu A. and Stănescu V. - ARCH. ROUM. PATH. EXP. MICROBIOL. 1957, 16/4 (609-626) Tables 8

In addition to stringent asepsis and antiseptics of the whole hospital staff, limitation to 24 hr. of the contact of healthy puerperae and newborn infants with the maternity clinic is recommended, in order to diminish the hazard of infection with the epidemic type of staphylococcus. Prophylactic vaccination of pregnant women in the 9th month, and of puerperae with toxoids and stock-vaccines may be considered. Further bacteriological study of staphylococcal epidemics in hospitals is required. (XVII, 4\*)

Busu, I.

Action of procaine on the coagulation of blood. N. Hortolomei, G. Proci, I. Busu, D. Marinescu-Slatina, N. Enescu, and G. Mihail. *Commun. acad. rep. populare Romane* 2, 759-62(1952).—The effect of procaine on the coagulation of blood was studied *in vitro* and by injecting therapeutically used doses in human patients and in dogs. The time of coagulation and of prothrombin were reduced, while the calcemia remained unchanged. The effect of 200 mg. of procaine persisted for about 20-40 min. The procaine also reduced the usual effect of heparin. The fact that it is destroyed in the living organism makes possible the use of large amts. of procaine for anesthesia.

Francois Kertesz

BUSU I.

↙  
The action of procaine on the gastric response during the excitation of the vagus nerve. N. Hortolomei, Gh. Proca, I. Busu, and I. N. Enescu. *Comm. Acad. Rep. Populare România* 3, 223-8 (1953).—In studying the effect of procaine (I) on the gastric response at the excitation of the vagus nerve by administering intravenously 50 mg. I per kg. body wt., it was found that I inhibits the effect of the excitation of the vagus nerve on the heart, although this excitation always causes an excito-motor effect on the stomach. Under these conditions the amplitude of the gastric contractions decreases, the latent period of the excitation of the vagus nerve increases, while the inhibiting action of a new excitation occurring at the height of a gastric contraction disappears. The duration of the contraction is also reduced. Thus I is not completely identical to atropine in its action; its effect on the heart is similar, but that on the stomach is not. Splanchnectomized animals do not respond to excitation after I injection. François Kertesz

The action of procaine on respiration. N. Hortolungu, Gh. Proca, L. Busu, and I. N. Buescu. *Commun. Acad. Rep. Populare Romane* 3, 243-50 (1953).--The main action of procaine is not exerted on the afferent part of the respiratory reflexes, but on the central mechanism. During anesthesia an intravenous injection of procaine relieves dyspnea and also suppresses other troubles, such as agitation.

Action of procaine on respiration. II. N. Hortolomei, Gh. Proca, I. Busu, St. Roman, and I. N. Enescu. *Comun. Acad. Rep. Populare Romine* 5, 173-84 (1955); cf. C.A. 50, 96041.—The main action of procaine (I) is on the central mechanism of respiration especially on the bulbar respiratory center and on the superior coordination system. On the bulb I diminishes the time of apnea. The action of I on the main centers is influenced by the conservation of cortical activity. I raises the frequency of respiration with intact cortex and sectioned pneumogastrics, but in animals without cortex no such raise is observed. I shortens the duration of the reflex apnea by animals with whole cortex, but without cortex no action of I is manifested. I acts on the pneumotaxic centers as in thermal polypnea, lowers the frequency of respiratory movements. The absence of cortex is marked by a stronger lowering of this frequency

"A Focus of Influenza A<sub>2</sub> in a Bucharest School During March 1965."

Bucharest, Studii si Cercetari de Inframicrobiologie, Vol. 17, No 4, 66, pp 293-298

Abstract: The authors describe an outbreak of type A<sub>2</sub> influenza in a Bucharest elementary school with a registration of 625 children. The outbreak was characterized by sudden appearance, small attack rate, prevalence of light forms and absence of complications. The etiology of the outbreak was confirmed by serological and virological studies.

Includes 2 figures, 5 tables and 8 Rumanian references. --

RU/0007/64/015/012/0638/0651

AUTHOR: Busuiocescu, C. (Engineer) <sup>44, 55</sup>

TITLE: Contributions to the study of drill stems with optimum section for mechanical coring with hard alloys <sup>18</sup>

SOURCE: Petrol si gaze, v. 15, no. 12, 1964, 638-651

TOPIC TAGS: drilling machine, <sup>14</sup> alloy, machine tool, solid mechanical property

Abstract [Author's English summary modified]: In mechanical coring by means of hard alloys the critical buckling length of the drill stem is low and their use is not possible because of the low weight on the bit. The perpendicular force on the wall of the well hole attains values of hundreds of kilograms force which cause rapid wear of the stems, enlargement of holes in poorly cemented rocks, and other inconveniences. The force exerted on the walls can be reduced by 25-35 percent by building heavy stems whose outer diameter equals that of the coring pipe and with a larger inner diameter, without reducing their weight per unit length. Orig. art. has 15 figures, 40 formulas, and 10 tables.

AUTHOR: Busygin, E. P.; Tumakayev, O. K.

TITLE: Measurement of the gas density behind a shock wave in a shock tube by an electron beam method

SOURCE: Zhurnal tekhnicheskoy fiziki, v.34, no.1, 1984, 122-127

TOPIC TAGS: density measurement, gas density measurement, electron gas density measurement, rapid gas density measurement, shock waves, argon shock waves, shock tube, shock tube shock waves

ABSTRACT: An apparatus is described for rapidly measuring gas densities in the pressure range from  $10^{-2}$  to 10-mm Hg by observing the change in electron beam current due to scattering by gas molecules. Density changes occurring in times of the order of a few microsec can be followed with an accuracy of 8 to 10 percent. The electron beam apparatus was mounted on a 3 x 30-cm rectangular shock tube and was employed to investigate the densities behind shock waves. The 30-keV electron beam was produced by an electron gun from a television kinescope. The beam entered the shock tube through a 1-mm opening covered by aluminum foil 5-microns thick. This

Card<sup>1/3</sup>

AP4009930

foil successfully withstood a static pressure of one atmosphere and the dynamic effects produced by the passage of shock waves. After traversing the shock tube, the beam left via a 1.5-mm opening, also covered by aluminum foil, and impinged on a terphenyl-polystyrene scintillator. The scintillator was observed by a photomultiplier tube, the output of which was displayed on an oscilloscope. The apparatus was calibrated by static measurements. Gas densities behind shock waves in argon were measured with the apparatus described. Mach numbers from 3 to 10 were achieved, and measurements were made at distances between 38 and 320 cm from the point at which the shock was initiated. The density discontinuities at the shock fronts agreed with the theoretical values (within the 10% accuracy claimed for the measurements). An approximately linear increase in density with distance behind the shock front was observed. This increase extended throughout the heated region, and its rate varied both with the Mach number of the shock and with the distance from the shock initiation point. The density increase is believed to be related to the development of flow in the shock tube. An alternative explanation offered by R.E. Duff (Phys.Fluids,2,207,1959) for a similar (but not entirely identical) density rise is considered doubtful, because escape of gas from the shock tube into the electron gun was possible in Duff's experiments and was not taken into account. The authors express their gratitude to Prof.Yu.A.Dunayev for his interest in the

TITLE: On the low voltage cesium vapor arc

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 3, 1966, 533-541

TOPIC TAGS: electric arc, cesium, electron temperature, electron density, cesium plasma, direct energy conversion, IR spectrum, electron temperature, spectral line

ABSTRACT: The authors have investigated the visible and near infrared spectra of low voltage hot cathode cesium vapor arcs. The investigation was undertaken because of the technical importance of cesium arcs for the development of energy converters and the presence in the literature of discordant data, particularly concerning electron temperatures. The electrodes were of molybdenum; the 4 x 4 mm working faces were plane and parallel. The cathode was of foil and was heated by direct current. The arc parameters were varied over the following ranges: electrode spacing, 0.5-2 mm; cathode temperature, 1400-1800° K; cesium vapor pressure, 0.5-5 mm Hg; current density, 2-20 A/cm<sup>2</sup>. The dispersion of the type DFS-12 spectrometer was 5 A/mm in the second order (3000-6000A) and 10 A/mm in the first order (6000-12 000 A). The FEU-38 photomultiplier employed to record the spectra was sensitive from 3000 to approximately 9000 A. The

Card 1/3

L 25494-66

ACC NR: AP6011402

arc was imaged at unit magnification on the spectrometer slit, which was parallel to the plane of the electrodes; conditions in the arc could thus be observed between the electrodes at different distances from them. Many cesium lines were observed in the spectrum. Electron temperatures were determined from line intensities in the sharp and diffuse series; the intensities were consistent with Boltzmann distribution of the level populations. The electron temperatures ranged from 1200 to 3000 or 4000° K. Electron concentrations were derived from the Stark broadening of lines of the fundamental series; electron concentrations of the order of  $10^{14}$  or  $10^{15}$   $\text{cm}^{-3}$  were observed. A number of forbidden lines were recorded. Electron concentrations derived from the forbidden line intensities as suggested by L.I. Grechikhin and Ye.S. Tyunina (TVT, 1, 399, 1963) were considerably lower than those derived from the Stark broadening. In low current arcs the electron temperature increased almost linearly with distance from the cathode throughout the whole electrode gap. In higher current arcs the electron temperature at first increased more rapidly with distance from the cathode than in low current arcs, but this increase did not persist throughout the full gap and the electron temperature was nearly constant throughout most of the arc. The spectrum lines were most intense in a region of the arc somewhat closer to the cathode than to the anode. The electron density was maximum at a short distance from the cathode. The position of the electron density maximum shifted toward the cathode with increasing arc currents, and at the highest currents the presence of a maximum could not be established. The physical mechanisms responsible for the observed distributions are discussed briefly but no definite conclusions are reached. The fact that the maximum electron temperature and maximum electron density occur in different

Card 2/3

L 25494-66

ACC NR: AP6011402

4

regions of the arc is difficult to explain without invoking stepwise ionization processes. The authors thank Ye.Ya.Shreyder for spectroscopic consultations, L.I. Grechikhin for making calculated data available to them, and B.Ya.Moyzhes and F.G.Baksht for discussions. Orig. art. has: 7 figures and 1 table.

ORG: Kazan' Veterinary Institute (Kazanskiy veterinarный institut)

TITLE: Complement-fixing antibodies in blood serum of rabbits immunized against foot-and-mouth disease

SOURCE: Veterinariya, no. 1, 1966, 109-111

TOPIC TAGS: antigen, antibody, blood serum, rabbit, foot and mouth disease, vaccine, immunization, gamma globulin

ABSTRACT: Complement-fixing antibodies were found in the sera of 11 rabbits immunized (subcutaneous inoculation in the spine and in one or all paws) with GNKI (State Scientific Control Institute) dry foot-and-mouth disease vaccine (Type 0) by the complement fixation test in the cold. The strength of immunogenesis and the content of gamma-globulins in blood serum were greater with injection in the paw than in the spinal region; these phenomena indicate the important role of the lymph nodes in the synthesis of foot-and-mouth disease complement-fixing antibodies. The virus of the GNKI vaccine, in spite of its reduced virulence, retains complement-fixing activity, and the authors consequently conclude that the vaccine can be used as antigen in complement fixation.
